SeaLife™ Kelp Meal for Soils

Introduction

SeaLife Kelp Meal for Soils is a graded kelp meal made from the seaweed *Ascophyllum nodosum*. We harvest the seaweed from the cold, clean waters of the Maine coast and dry it at low temperatures to preserve its valuable vitamins, minerals, trace elements, amino acids, and carbohydrates. The variety of nutrients in SeaLife feed and stimulate beneficial microbial populations in your soil, improving soil tilth and ultimately plant health and performance.

Usage

Standard application: Mix SeaLife into the soil in early spring and fall at a rate of 1 pound per 100 square feet or up to 300 pounds per acre.

For trees: Auger holes around the circumference of the dripline (the area directly under the outer circumference of the tree's branches). Apply 1 lb. of SeaLife per inch of tree caliper, distributed equally into the auger holes.

For potted plants: Mix 1 tbs. per 6 inches of pot diameter, when planting or re-potting.

For bulbs: Mix 1 tbs. per bulb into the soil when planting.

*3 cups of SeaLife ≈ 1

Benefits

Repeated applications will gradually improve soil texture, structure, aeration, and water and nutrient holding capacity as SeaLife provides the organic matter and nutrients necessary for a healthy soil microbial community. A healthy soil microbial community increases fertility and makes essential amino acids available to plants, while also suppressing the growth of other potentially harmful microbes.
